

ABSTRACT OF THE DISCLOSURE

10 A multiple registration system of using the same account for a user to register
different devices to a DRC (digital right certificate) server for further downloading a
digital content from the network is disclosed. The system comprises a first device,
which includes a first reader and a first device identity code, a second device, which
includes a second reader and a second device identity code, and the DRC server. The
first device and the second device can build connections with the DRC server through
15 the network. The DRC server is for providing the first or/and the second device to
apply an account and to use the same account for further downloading the digital
content. During registration, the reader stores the account and an identity code of its
own device in its own right record file. When the reader starts retrieving the digital
content for reading, in order to prevent illegal copy and distribution, it will check if the
right record file has been modified, and check if the identity code in the right record file
20 matches correctly with the device code of the present device in use.
